1.0 Project Planning

1.1 Problem Statements

Problem 1

Problem	Manual Operations Management
Description	All business processes in Eventure including client inquiries, event coordination, and logistics are handled manually.
Causes	- Limited resources - Absence of an integrated digital system.
Effects	- This leads to inefficiencies in daily operations, - Increased likelihood of mistakes, delays in responding to client requests - Challenges in scaling the business as it grows.

Problem 2

Problem	Lack of Online Booking Platform
Description	Clients cannot view services, check availability, or book events directly online
Causes	the company depends on manual scheduling, which is prone to errors and miscommunications.
Effects	This causes a considerable risk of booking errors and miscommunication, resulting in lost business opportunities and diminished customer satisfaction

Problem 3

Problem	Manual Financial Management
Description	Financial processes, such as tracking expenses, generating invoices, and

	monitoring payments, are performed manually
Causes	• Leads to reliance on manual calculations and record-keeping. • Increasing the likelihood of human error
Effects	• This causes a considerable risk of billing errors. • Delays in financial reporting • Inefficient financial analysis, which can adversely affect cash flow management and overall profitability.

Problem 4

Problem	Inefficient Customer Feedback and Service Improvement
Description	Feedback from clients is collected informally and not systematically analysed to drive service improvements.
Causes	• Customer opinions are gathered irregularly. • Not linked to service development or process reviews.
Effects	• This results in repeated service errors, • Missed opportunities for enhancement. • diminished customer satisfaction and loyalty

Problem 5

Problem	Scalability and Flexibility Issues
Description	The current manual systems are unable to effectively support increased workload and changing business needs as Eventure grows.
Causes	• Reliance on outdated, non-automated processes that are rigid and unable to integrate with modern digital tools hampers the business's growth potential.
Effects	• This leads to operational bottlenecks. • Higher costs • An inability to quickly adapt to market changes, • Negatively impacting long-term business sustainability.

1.2 Scopes and Objectives

Scopes

1. Digital Integration for Operations Management

- This initiative encompasses the digitization of all existing manual operations, which include client inquiries, event scheduling, coordination, and logistics, through the creation of a unified digital platform. The objective is to consolidate various processes into a single, cohesive system.

2. Online Booking System

- This project aims to develop a web-based portal that enables clients to obtain information regarding services, verify the availability of events in real-time, and make bookings autonomously. Additionally, it will function as a platform for clients to oversee their event details and interact with the Eventure team.

3. Automated Financial Management

- This scope emphasizes the incorporation of a specialized financial module within the comprehensive system. It includes the automation of various tasks, such as expense tracking, invoice generation, payment monitoring, and the production of real-time financial reports.

4. Customer Feedback and Service Improvement System

- This scope encompasses the establishment of a systematic approach to collect feedback from clients following an event. It may incorporate elements such as online surveys, rating systems, and comment sections designed to obtain comprehensive customer insights.

5. Scalable and Flexible System Architecture

- This scope focuses on the development of a resilient system architecture that addresses present operational requirements while ensuring scalability for future growth. It

encompasses the selection of appropriate technologies and the design of modules that can be readily updated or integrated with new tools as business needs change.

Objectives

1. Automate core business processes

- The aim is to automate these essential functions in order to minimize human error and administrative flaw. By optimizing operations, the organization can execute tasks with greater speed and precision, leading to enhanced operational efficiency and scalability as the business grows.

2. Enable direct online booking

- The aim is to substitute the manual and error-prone booking procedure with an automated system that improves the customer experience. This self-service model not only minimizes scheduling errors and miscommunications but also facilitates client engagement with Eventure at any time, thereby expanding business opportunities.

3. Streamline financial processes

- The aim is to reduce reliance on manual financial record-keeping, which is susceptible to inaccuracies and delays. Implementing automation in this domain will facilitate more precise billing, prompt payment processing, and offer financial insights that enhance decision-making and optimize cash flow management.

4. Systematically collect and analyse customer feedback

- The aim is to convert occasional, informal feedback into practical data. Through the systematic collection and analysis of customer responses, Eventure can pinpoint recurring problems, improve service offerings, and elevate overall customer satisfaction and loyalty.

5. Design an adaptable system for future growth

- The aim is to develop a system that is adaptable and able to manage heightened workloads and new functionalities without requiring major modifications. This forward-thinking design guarantees that the digital platform stays dependable, reduces

upgrade expenses, and facilitates sustained growth in an ever-evolving market landscape.

1.3 Project Scheduling

Gantt Chart

Figure 1 Gantt Chart of Project Scheduling

The Gantt chart for the Eventure Event Management System provides a structured visual representation of the project's timeline, detailing the tasks, phases, and dependencies necessary for successful implementation. The project is divided into five major phases: Planning, Analysis, Design, Implementation, and Security & Support, spanning from November 26, 2024, to February 15, 2025. The Planning phase involves defining the project scope, assessing risks, allocating resources, and setting milestones to establish a clear foundation. Following this, the Analysis phase focuses on gathering requirements, modelling data and processes, and assessing feasibility to ensure the system aligns with business needs. The Design phase translates these requirements into a structured blueprint, covering database architecture, user interface (UI) design, and prototype development to create a functional roadmap for developers.

The Implementation phase is where the actual development takes place, starting with UI development, system coding, integration of components, rigorous testing, and debugging to ensure functionality before deployment. After deployment, the Security and Support phase is dedicated to user training, system maintenance, and collecting feedback for future improvements. Each task is dependent on the previous, ensuring a systematic and organized workflow. The project timeline allows ample time for testing and debugging, preventing potential issues before final deployment. Given the complexity of transitioning from a manual system to a fully digital one, a Parallel Operation system changeover method is recommended, allowing both the old and new systems to run simultaneously until stability is ensured. The final phase includes user training and maintenance, ensuring that stakeholders can efficiently utilize the system while IT support remains available for troubleshooting. Overall, the Gantt chart ensures a structured, risk-mitigated, and efficient approach, ensuring that the Eventure system is delivered on time, fully functional, and seamlessly integrated into business operations.

2.0 Agile Principles and IS Methodologies (Individual Task)

2.1 Agile Principles

2.1.1. Accept Changes – (Anusha)

Agile is all about being open to change, even when the work is already in progress. For a growing business like Eventure, this idea is very helpful. As the company expands, new needs can pop up unexpectedly. For example, they might need real-time booking updates, a way to connect with different payment systems, or improved methods to track how well their vendors are doing. Instead of getting stuck with a fixed plan, Agile lets the team make changes as they go.

The team works in short cycles called sprints. Each sprint produces a small, working part of the overall system. This means that if Samantha or her customers decide they want a new feature or a tweak to an existing one, the team can add or adjust it in the next sprint. For instance, if clients suggest that the online booking page should be easier to use, the team can work on that change right away without redoing all of the work already done.

This way of working makes sure that the final product always matches what Eventure needs at the time. It also keeps the system useful for the future because it is built to handle change. By welcoming new ideas and adapting quickly, the risk of building a system that feels outdated or out of touch is greatly reduced. In the end, Agile helps create a product that stays relevant and valuable as Eventure grows and its goals evolve.

2.1.2. Rapid Releases – (Anusha)

One of the key ideas of Agile is to deliver a working version of the software regularly, usually every few weeks instead of waiting for months or years. This means that instead of a long, drawn-out development period, the team releases small, complete pieces of the system step by step.

For Eventure, this approach is very beneficial. Even while the entire system is still being built, parts of it can be used right away. For example, a basic version of the client portal or the task management tool might be ready within the first few weeks. With these early releases, the company can begin to fix problems and improve processes immediately which will cut down on the delays and errors that can happen with manual work.

Working in short cycles, or sprints, allows the team to focus on one small part at a time. At the end of each sprint, they review what has been built and invite feedback from stakeholders. This feedback is very useful because it shows what is working and what needs to be changed. If Samantha or the clients find that a new feature is needed or that something isn't working as expected, the team can adjust it in the next cycle. This regular delivery of working software builds confidence among everyone involved. Stakeholders can see clear progress, which helps them feel reassured about the project. It also means that any issues are discovered early, making them much easier and cheaper to fix. In short, frequent releases lead to faster improvements, a lower chance of big problems later, and a final product that truly meets the business needs.

2.1.3. Daily Collaboration – (Hemanth)

Agile stresses that businesspeople and developers should work closely together every day. For Eventure, this daily interaction is key because the system must reflect real business needs. When Samantha and her team communicate with the developers each day, everyone stays on the same page about what needs to be built. Daily meetings or quick check-ins help answer questions right away. This continuous dialogue makes it easier to catch any misunderstandings before they become big issues. For example, while working on the online booking system, regular discussions ensure that the design is simple and fits the way Eventure operates. If something isn't clear, it can be sorted out immediately.

This close cooperation also helps build a sense of shared ownership. Both the businesspeople and the developers feel responsible for the final product because they are involved in every step. It means that if the financial management feature needs extra accuracy or a new report format, Samantha can give her input directly, and the developers can adjust the work quickly. When everyone works together every day, there is less chance for errors to slip through. The developers understand the real needs of the business, and the businesspeople see how the

system is coming together. This teamwork makes it easier to meet deadlines and ensures that the system is user-friendly and effective. In the end, a strong daily collaboration means the final software is much more likely to meet Eventure's requirements and serve its customers well.

2.1.4. Sustained Quality – (Hemanth)

Agile also places high importance on keeping the code and design of the software at a high standard throughout the project. For Eventure, this means building a system that is not only strong and reliable but also simple to update as the business grows.

Technical excellence means writing clean, well-organized code. For instance, the financial management module must handle many calculations and generate correct reports. If the code is messy, small changes might lead to big mistakes, which could affect Eventure's financial records. By focusing on quality from the start, the team makes sure each part works well and is easier to fix later.

Good design goes hand in hand with technical quality. It is not just about how the software looks but also about how it works. A well-designed system, such as the client portal, should be able to handle more users and more data without slowing down. The team achieves this by using a modular approach by building different parts of the system separately so that updating one section doesn't affect the others.

The team also spends time reviewing and testing the software regularly. This continuous attention to detail helps catch any issues early before they turn into major problems. Regular testing and code reviews ensure that any potential bugs or design flaws are fixed quickly.

By maintaining high standards for both code quality and design, Eventure's software remains robust and flexible. This makes it easier to add new features or change existing ones in the future without causing disruptions. In the long run, this focus on technical excellence means that the system will continue to perform well as the business grows, helping Eventure stay competitive in a fast-changing market.

2.1.5 Customer Satisfaction by Early and Continuous Delivery (Darmik Ishwar)

One of the core principles of Agile development focuses on delivering value to customers through early and continuous software delivery. This principle emphasizes that by releasing functional software at regular intervals, customer satisfaction is enhanced because users can see tangible progress, provide feedback, and ensure the product aligns with their expectations. To implement this principle effectively, the development team will adopt an iterative approach, meaning the project will be broken down into multiple short cycles or sprints, each producing a working increment of the software. Instead of waiting until the final stages of development to present a complete product, the team will release functional features progressively. This approach not only reduces risks associated with last-minute changes but also allows the team to validate assumptions early on. Engaging with stakeholders early and frequently is crucial in this process. Regular client meetings, sprint reviews, and product demonstrations will be scheduled to gather feedback, ensuring that the software evolves according to business needs. By continuously refining the product based on customer input, the team can proactively address concerns, prioritize high-value features, and eliminate unnecessary development efforts on functionalities that do not add value. Additionally, this principle ensures that any potential issues or misunderstandings about the project scope are identified and corrected in earlier stages, rather than causing significant disruptions in the later phases. The key benefit of this approach is that it fosters trust and transparency between the development team and stakeholders, as clients can actively monitor progress and request adjustments in real-time. This method leads to a higher-quality product that aligns more closely with user needs while minimizing the risk of late-stage failure.

2.1.6 Welcome Changing Requirements, Even in Late Development (Darmik Ishwar)

Traditional software development models often resist changes in requirements, especially during the later stages of development, as modifications can be costly and time-consuming. However, Agile methodology embraces changing requirements at any stage of the development process, recognizing that business environments and customer needs are dynamic. This principle ensures that the team remains adaptable and responsive to new priorities, market conditions, or emerging business opportunities. To effectively implement this principle, the team will use a flexible backlog management approach. The product backlog will act as a living document, where new requirements can be introduced, prioritized, or modified at any stage based on changing business needs. Regular backlog refinement sessions will be conducted to evaluate new requests, assess their impact on the project, and determine the best way to incorporate them without disrupting the existing workflow. Additionally, the team will adopt Agile frameworks such as Scrum or Kanban, which are designed to handle evolving requirements efficiently. Scrum's sprint planning meetings will allow the team to reassess priorities at the start of each iteration, ensuring that the most critical changes are addressed without compromising delivery timelines. Similarly, Kanban's continuous flow methodology enables the team to integrate modifications as they arise, rather than waiting for a predefined cycle. To manage late-stage changes effectively, Agile teams also focus on modular and incremental development, where each feature or component is built independently. This allows new functionalities to be introduced without affecting the overall system stability. Moreover, comprehensive automated testing and continuous integration (CI/CD) pipelines will be utilized to ensure that late-stage changes do not introduce unexpected issues or regressions. By welcoming changing requirements, even in the later stages of development, the team ensures that the final product remains aligned with business goals and evolving customer needs. This flexibility enhances competitiveness, innovation, and customer satisfaction, making Agile development a superior approach for modern, fast-paced business environments.

2.1.7 Emphasizing Technical Excellence and Good Design – (Adam Joseph)

The creation of a reliable, scalable, and high-performing system depends heavily on technical prowess and sound design. In the Eventure project, upholding strict coding guidelines and carefully planned software guarantees that the system may be modified to accommodate future developments while reducing technological debt. High-quality development methods result in quicker progress and greater long-term, sustainable success, according to this Agile principle.

Code reviews and pair programming, in which engineers work together to find inefficiencies and enhance the quality of code prior to integration, are two important tactics for preserving technical excellence in Eventure. This guarantees the continual application of best practices, like following coding guidelines and using effective problem-solving strategies. In order to find defects early and keep software reliability high, the development team will also give priority to automated testing utilizing frameworks.

Additionally, frequent technical workshops and team knowledge-sharing sessions will promote ongoing learning and development. Enhancing system performance, improving security protocols, and implementing industry best practices will be the main topics of these talks. Eventure will be in a good position to manage changing business needs and technological improvements by integrating technical excellence into the development lifecycle, in addition to meeting its urgent requirements.

2.1.8 Delivering Working Software Frequently – (Adam Joseph)

Instead of waiting until the full system is finished, the idea of delivering working software frequently guarantees that functional system components are provided in brief, regular cycles. With this method, people can interact with the system early on, offer suggestions, and have an impact on its advancement. This idea will be put into practice for the Eventure project by introducing functional modules like user registration, event planning, and payment processing in smaller updates.

The development team will focus on creating and implementing a working portion of the system using a sprint-based methodology, with each sprint lasting roughly two weeks. This guarantees that while the system is still under development, administrators, attendees, and event planners can begin utilizing important features. Continuous Integration and Continuous Deployment (CI/CD) pipelines will be used to provide automated testing and seamless feature integration, enabling changes to be made smoothly and efficiently. The Eventure project reduces risks, guarantees early problem identification, and boosts user happiness by regularly releasing functional software, which makes the finished product more dependable and focused on users.

2.1.9 Self-Organizing Teams – (Sailess Raj A/L Rajendran)

One of the principles surrounded in Agile is that results are optimally produced from self-organizing teams. Significantly than being pushed with a severe ordered framework, Agile helps teams adopting ownership of the work, operational organised, and deciding based on their capability. The result is innovation, accountability, and responsiveness, which are critical to an engaged project such as Eventure.

The first implementation of Self-Organizing Teams for Eventure is Empowering the Development Team. The Eventure project would assign developers, analysts, and designers the liberty to create intellectual options concerning system functionality, user experience, and workflow. The corporation preserve advance a culture of innovation and responsibility by believing the verdict of its people. Next, Promoting Cross-Functionality. An efficient Agile team comprises of people with numerous skills. Designers, UI/UX designers, and business analysts must all cooperate toward tackle various aspects of the system. Cross-functionality will guarantee that the system is being created holistically, and technical along with business needs are being considered.

Then, Daily Stand-Ups for Alignment. To sustain arrangement, the team should have a regular stand-up meeting where all the members share their progress, problems, and upcoming work. The short meetings aid in identifying troubles early on and keep everyone on track towards project goals. Lastly, Continuous Feedback Loops. With standard client feedback meetings, the development team can modify features in real time. By combining stakeholders at each phase, Eventure can keep the system in line with business requirements and end-user requirements.

By adopting self-organizing teams, Eventure can reap the advantages of fast decision-making, increased collaboration, and better adaptability. This results in creating an efficient, easy-to-use event management system that is capable of growing with the company.

2.1.10 Simplicity – The Art of Maximizing the Work Not Done - (Sailesh Raj A/L Rajendran)

The other Agile principle is simplicity, which includes giving just sufficient and non-more and not establishing pointless difficulties. Agile persuades lean development, which promises the best exploitation of resources and highest value. For Eventure, this principle promises that the system is lightweight, user-friendly, and sustainable.

The first implementation of simplicity for Eventure are Prioritizing Core Functions. Significantly than struggling to grow all factors simultaneously, the group should focus on progressing core works first. Essential functions like event scheduling, vendor management, and task management must be prioritized. Further features may be added incrementally as per user requirements and business demands. Next is Avoiding Over-Engineering. While customization is a benefit, over-difficulty in system design can lead to ineffectiveness. The system must remain minimal in model so that it can be used easily by users without any unnecessary technical overhead.

Then, Applying Lean Documentation. Classic software development expects enormous documents that hurriedly becomes outdated. Agile encourages keeping only the needed documentation, user stories, system flowcharts, and brief technical note, so that time is supplied innovative development rather than profligate paperwork. Last but not least, Automation of Repetitive Tasks. Eventure also render processes efficient by presenting automation for repetitive tasks like generating invoices, event reminders, and reports. This saves manual effort and increases efficiency.

Through simplicity, Eventure can do alert event times, eased cost, and corrected usability. Future adding of functions keeps the system open while ensuring the key functionality is delivered with optimum efficiency.

2.2 IS Methodologies

2.2.1 Rapid Application Development (RAD) – (Hemanth)

Rapid Application Development (RAD) is a flexible methodology that emphasizes fast prototyping and repetitive development. It emphasizes quickly providing functional components of the system, incorporating continuous user feedback. RAD consists of four key phases that are requirements planning, user design, construction, and cutover. Its primary benefit is its versatility and rapidity, which makes it ideal for projects that require fast completions and the ability to adjust to evolving needs.

Requirements Planning and Quick Design

The project started with a requirement planning phase, where Samantha and her team collaborated with developers to outline the system's needs, project scope, and constraints. This phase involved identifying critical functionalities such as the client portal, vendor management, and financial tracking. The team then moved to the quick design stage, where they created preliminary models and prototypes to visualize the system's structure. This helped stakeholders understand the system's layout and flow, enabling quick feedback before development began. Samantha reviewed the client portal prototype and suggested modifications to the user interface, which were incorporated immediately.

Prototype Cycles

Eventure adopted an iterative and incremental prototyping approach, where the system was built in smaller, functional parts. The development process was divided into short cycles, focusing on one component at a time.

- **Development Phase:** The team first developed the core functionalities of the client portal. As the screens and reports took shape, Samantha and her team provided feedback on usability and design. The developers adjusted in real-time, allowing the system to evolve according to user needs.

- **Demonstration and Refinement:** After each cycle, the team demonstrated the progress to Samantha and collected feedback. This iterative loop allowed for continuous refinement, ensuring the system's features were aligned with Eventure's operational requirements. For instance, after testing the vendor management prototype, Samantha requested enhancements for contract tracking, which were implemented in the next iteration.

Testing and User Feedback

The Testing Phase was conducted concurrently with the prototype cycles. As each component was developed, it was tested for functionality and integration with other parts of the system. Eventure involved Samantha and her team in this phase, allowing them to provide immediate feedback on usability and performance. This ensured that issues were identified and resolved early, reducing the risk of costly rework. For example, while testing the financial tracking module, the team detected calculation errors, which were promptly fixed before progressing to the next feature.

Deployment and User Training

Once the prototypes were finalized and tested, Eventure moved to the Deployment Phase. This stage involved:

- **Data Conversion:** Transferring existing client and vendor data into the new system.
- **User Acceptance Testing (UAT):** Samantha and her team tested the system's functionality in a live environment to ensure it met their needs.
- **Changeover to the New System:** Eventure transitioned from manual processes to the automated system, enabling Samantha's team to streamline operations.
- **User Training:** To ensure a smooth transition, the development team provided training sessions, helping users familiarize themselves with the new system.

This phase allowed Eventure to go live with a fully operational system much faster than traditional development methods, ensuring minimal disruption to business activities.

Continuous User Involvement and Feedback Loop

RAD's emphasis on continuous user involvement was a key factor in Eventure's success. Samantha and her team were actively engaged throughout the project, participating in design discussions, prototype reviews, and testing. This close collaboration ensured that the system was built precisely to Eventure's requirements, minimizing the risk of miscommunication and feature misalignment. For example, Samantha's feedback on the client portal's user experience was integrated immediately, leading to a more intuitive interface.

Flexibility and Adaptation to Change

RAD's flexibility enabled Eventure to adapt to changing requirements without disrupting the project. As the business grew, new needs emerged, such as real-time booking updates and integration with payment gateways. The team incorporated these changes seamlessly during the prototype cycles. For instance, when Samantha requested an automated notification feature for booking confirmations, the team quickly added it to the prototype, ensuring rapid delivery without compromising the project timeline.

Incremental Scaling and System Expansion

Eventure leveraged RAD's iterative model to scale the system incrementally. The project started with core functionalities like client and vendor management. Once these were successfully deployed, more advanced features such as financial tracking and automated notifications were added in subsequent cycles. This allowed Eventure to continuously enhance the system, aligning it with the growing business demands while maintaining stability and performance.

Cost Efficiency and Rapid Delivery

By delivering functional components early and refining them based on real-time feedback, Eventure significantly reduced development costs and timelines. RAD's time-boxed iterations ensured rapid delivery of working prototypes, allowing the team to make informed decisions and avoid costly rework. This accelerated delivery enabled Samantha to start automating manual processes sooner, reducing operational inefficiencies and boosting productivity.

2.2.2 Scrum – (Anusha)

Scrum is an agile framework that Eventure is utilizing to improve teamwork, encourage gradual advancements, and guarantee the consistent delivery of operational software. At Eventure, the development team employs brief, time-limited intervals called "sprints," spanning 2-4 weeks, to concentrate on providing particular features. This method entails strong cooperation between developers and stakeholders via frequent meetings, such as daily stand-ups and sprint reviews, ensuring that the project remains on schedule and fulfils user needs.

Sprint Planning

Eventure began by conducting Sprint Planning sessions involving the development team, Scrum Master, and Product Owner that is Samantha. During these meetings, the team identified the high-priority features needed for the system, such as the client portal, vendor management, and financial tracking. These features were broken down into smaller, manageable tasks, forming the **Sprint Backlog**. This approach allowed the team to focus on delivering specific functionalities within each sprint cycle.

Daily Scrum Meetings

Daily stand-up meetings were held to ensure transparency and keep the team aligned on progress. During these 15-minute meetings, each team member shared what they worked on the previous day, what they planned to do next, and any obstacles they faced. This practice

enhanced communication and helped quickly resolve issues, ensuring that the project stayed on track.

Sprint Development and Incremental Delivery

Eventure's team worked in 2–4-week Sprints, focusing on delivering small, functional parts of the system incrementally. For example, during the first sprint, the team prioritized developing the client portal's basic features, enabling Samantha to start automating client interactions early. In subsequent sprints, the team expanded functionality to include vendor management and financial tracking. This incremental approach allowed Eventure to adapt the system as requirements evolved.

Sprint Review

At the end of each sprint, Eventure conducted a Sprint Review, where the team demonstrated the completed features to Samantha and other stakeholders. This meeting provided an opportunity for Samantha to test the new functionalities and give feedback. For instance, after reviewing the vendor management system, Samantha suggested improvements for tracking vendor contracts, which were incorporated into the next sprint.

Sprint Retrospective

Following each Sprint Review, the team held a Sprint Retrospective to evaluate what went well and what could be improved. This continuous improvement cycle helped the team refine their processes and enhance productivity. For example, the team identified that communication gaps led to minor delays in the financial tracking module. To resolve this, they adjusted their collaboration strategy, ensuring closer communication during development.

Product Backlog Management and Adaptation

The **Product Backlog** was maintained and updated regularly by Samantha as the Product Owner. As Eventure's business needs grew, new features like automated notifications and real-time booking updates were added to the backlog. Scrum's flexibility allowed the team to

prioritize and integrate these changes seamlessly in upcoming sprints without disrupting the overall project flow.

Risk Mitigation and Quality Assurance

By delivering functional increments in short sprints, Eventure's team was able to identify and resolve issues early. This approach minimized the risk of costly rework. For example, when testing the vendor tracking feature, the team discovered inconsistencies, which they resolved in the following sprint, ensuring the system's reliability.

Scalability and Continuous Improvement

Eventure's implementation of Scrum enabled the system to scale with business growth. The initial version included basic client and vendor management features, while more advanced functionalities like financial tracking and automated notifications were added in later sprints. This iterative approach ensured continuous enhancement and alignment with Eventure's evolving needs.

2.2.3 Waterfall model (Darmik Ishwar)

The Waterfall Model is a structured and sequential software development methodology that ensures each phase is completed before moving to the next. This approach is best suited for projects with clearly defined requirements and minimal scope for changes, making it ideal for developing the Eventure Event Management System. The project begins with requirement gathering and analysis, where all stakeholders, including event planners, vendors, and clients, provide detailed input on the system's functionality. This phase involves defining event scheduling needs, vendor management features, and financial tracking mechanisms, ensuring that the project has a well-documented foundation before moving forward. Once the requirements are finalized, the design phase focuses on defining the system architecture, database structures, and user interfaces, laying the groundwork for development. During this stage, high-level designs and low-level designs are created, along with database schemas and wireframes, ensuring that the software blueprint is well-structured. Following the design phase, the implementation phase begins, where developers code the system based on predefined specifications. This includes building core event scheduling, vendor management, and financial tracking modules, ensuring that each component aligns with business objectives. Once development is complete, the system undergoes rigorous testing, including unit testing, integration testing, and system testing, to verify that all features function correctly. Since the Waterfall Model follows a late testing approach, this phase is crucial in identifying and fixing issues before deployment. After successful testing, the system is deployed to the production environment, where event planners and vendors can start using the platform. To ensure smooth adoption, training sessions are provided to users, followed by a maintenance phase, where the system is regularly updated, bug fixes are implemented, and security measures are reinforced. The Waterfall Model provides several advantages for the Eventure project, including clear documentation, structured workflows, and thorough testing processes, making it a stable and predictable development methodology. Its linear approach ensures that all functionalities are well-planned and systematically executed, reducing the risk of errors and inconsistencies. However, a key limitation is its lack of flexibility, as changes in requirements after the initial phase can be costly and time-consuming to implement. Unlike Agile methodologies, where testing and feedback are integrated continuously, the Waterfall approach relies on extensive planning upfront, making it best suited for projects where the requirements are unlikely to change. Despite this, the Waterfall Model remains a reliable choice for large-scale enterprise systems like Eventure, ensuring that all business-critical operations, such as event bookings,

vendor coordination, and financial management, are implemented in a structured, organized, and error-free manner.

2.2.4 Feature-Driven Development (FDD) – (Adam)

The Agile-based IS technique known as "Feature-Driven Development" (FDD) aims to offer system functionality in tiny, incremental feature sets. FDD places a higher priority on feature-based development than approaches that stress tight deadlines or quick prototyping. This makes it perfect for intricate projects like Eventure, where several separate components—like event planning, guest management, and payment processing—need to be developed concurrently.

1. Develop an Overall Model

Understanding the Eventure business needs and creating a broad system model are the main goals of this phase. The development team makes ensuring that the system meets the operational requirements of administrators, attendees, and event planners by involving stakeholders early on. The identification of essential features like ticketing, event administration, and financial transactions is based on this model.

2. Build a Feature List

The features of the system are clearly specified and in line with business requirements. Features like "Attendees can register and pay for tickets," "Organizers can create events," and "Admins can manage user permissions," for example, are grouped and given priority. Each element is guaranteed to be precisely defined and directly contribute to the overall operation of the system because of to this organized feature list.

3. Plan by Feature

Small development teams are given each feature, and dependencies and business impact are used to determine priority. To guarantee that the most important features are supplied first, high-priority features like event creation and ticket purchase are created first. Parallel development is ensured throughout this phase, which lowers inefficiencies and speeds up system completion.

4. Design by Feature

Every aspect, including database structure, system interactions, and user interface elements, has a comprehensive technical design. Developers can ensure consistency and maintainability by using domain modelling to better understand how features relate to one another. This entails specifying structured and scalable interactions between event planners, participants, and payment mechanisms for the Eventure system.

5. Build by Feature

Every feature is developed, tested, and integrated continuously. FDD ensures that every feature is completely functioning before moving on to the next, as opposed to rigid development methodologies. This improves system stability and lowers errors. At this point, ongoing user feedback is integrated to make sure features live up to user expectations prior to final release.

The Eventure project team can effectively create a scalable event management system while retaining adaptability by utilizing FDD. This project is the perfect fit for the structured, feature-driven approach since it enables parallel development, quicker delivery of essential functionalities, and improved alignment with customer needs. By keeping stakeholders actively involved, the approach permits ongoing development and modification in response to changing needs.

2.2.5 Spiral Model – (Sailess Raj A/L Rajendran)

The Spiral Model is a risk driven IS methodology that mixes iterative aspect improvement using organised risk measurement and organisation. It is perfect for dense and risky plans such as Eventure, where constant improvement, massive planning, and rigorous evaluation are needed. This model guarantees system dependability by delivering risks early and combining user feedback in multiple iterations.

1. Determining Objectives and Identify Risks

In this stage, the Eventure project team facilitates thru shareholders to describe the system's goals, constraints, and risks. Key requirements, such as event formation, attendee registering, and payment processing, are recognized. Ability risks like security weaknesses in financial transactions are analysed to determine improvement approaches before continuing to improvement.

2. Develop and Refine the Prototype

An initial prototype of the Eventure system is developed with least features such as event listing, login for users, and ticket selling. The prototype is benefited as a base for initial feedback collection and testing of fundamental system features. Modification is done based on user feedback and risk analysis prior to full-scale development.

3. Engineering and System Development

With the capability gained from the model, the system is developed in a structured manner. Every element, event management, guest handling, and financial transactions, is developed in incremental cycles. The Spiral Model's reiterative method promises that developments and improvements are absorbed on a continuous basis, decreasing sudden breakdowns in the future.

4. Review and Plan the Next Iteration

At the finale of every cycle, the system is repeated with participants to decide make progress, discover new risks, and indicate conditions. Any functional, security, or performance gaps are plugged preceding to increasing to the successive iteration. The iterative aspect process repeats until the Eventure system is complete, absolutely evaluated, and prepared for deployment.

Why the Spiral Model for Eventure?

Concluded the application of the Spiral Model, the Eventure project development team has a formal but variable procedure of growth. The representation's focus on risk management, continuing user interaction, and iterative aspect modification meets it suitable for a large system with varied features incorporated into it. The procedure template improves system consistency, reduces collapses towards the later phases, and guarantees that the product addresses user expectations in an adequate manner.

3.0 System Analysis

3.1 Cost-Benefit Analysis (CBA)

Cost-Benefit Analysis (CBA) assesses the financial viability of adopting the Eventure system by contrasting the overall costs with the anticipated benefits. This approach is vital since Samantha has set aside a budget of RM 75,000 and aims to secure a favourable return on investment. CBA assists Eventure in determining if the advantages of the system, including higher income from online reservations, savings from automation, and enhanced customer satisfaction, warrant the upfront investment.

The CBA entails recognizing both direct and indirect expenses, encompassing development costs, fees for third-party integrations, training expenditures, and continual maintenance. It also considers tangible advantages such as higher income from additional bookings and savings from decreased manual tasks, along with intangible benefits like improved customer satisfaction and better operational efficiency. By assessing financial indicators such as Net Present Value (NPV), Return on Investment (ROI), and Payback Period, the evaluation offers a distinct view of profitability. For instance, with a projected revenue rise of RM 150,000 annually and yearly cost reductions of RM 30,000, the payback period is anticipated to be 9 months. This financial analysis guarantees that the investment aligns with Eventure's growth plan, aiding Samantha in making well-informed budget choices.

3.2 Fishbone Analysis

Fishbone Analysis plays a critical role in identifying the underlying causes of inefficiencies within the business. Fishbone Analysis was chosen because it provides a structured way to examine the root causes of operational issues that Eventure currently faces, such as event scheduling conflicts, slow client response times, and disorganized vendor management. By visually mapping out potential causes of inefficiencies, the team was able to categorize problems into different areas, including People, Processes, Technology, Financial, and Customer Experience. For example, under the People category, one of the major issues identified was insufficient IT expertise among staff, which contributed to delays in responding

to client inquiries. In the Process category, the reliance on manual event scheduling led to errors and double bookings. Similarly, in the Technology category, the absence of a centralized vendor database made it difficult to track contract agreements and vendor performance.

Fishbone Analysis was selected by us because it specifically focuses on identifying root causes rather than just symptoms or high-level strategic insights. Fishbone Analysis provides a clear cause-and-effect relationship, allowing the us to narrow down into specific problem areas and develop targeted solutions. By using this method, our team can recommend automation for event bookings, a vendor rating system for better supplier selection, and a task management feature to improve internal workflow, all of which directly address the root causes of Eventure's operational inefficiencies.

4.0 System Design

4.1 Use Case Diagram - (Adam)

Figure 2 Use Case Diagram of Eventventure

The customer, vendor, and staff are the three main characters in the use case diagram, which illustrates the Eventure Event Management System's functionalities. Each actor uses various system functionalities.

Actors and Their Functionalities:

Customer

- **Register & Login System:** Customers must log in to access the system.
- **Browse Available Services:** Customers can view services before making a booking.
- **Check Event Availability:** Ensures the desired event date is available.
- **Book an Event:** The main function for customers to reserve events.
- **Make Payments:** Required to confirm event booking (includes relationship with "Book an Event").
- **Receive Notifications & Updates:** Customers get automated updates about their events.
- **Provide Feedback on Event Experience:** Allows customers to review their experience.

Vendor

- **Register & Update Profile:** Vendors must register to offer services.
- **Submit Quotation for Services:** Vendors send pricing proposals for events.
- **Accept or Decline Event Requests:** Vendors can approve or reject event service requests.
- **Upload Contracts & Agreements:** Documents necessary for engagement.
- **View Assigned Events:** Vendors can track the events in which they are involved.
- **Submit Feedback Post-Event:** Vendors can review the event process.
- **Provide Vendor Ratings (extends "Submit Feedback Post-Event")** - This means that providing vendor ratings is **optional** and happens **only if the vendor was involved in the event**.

Staff

- **Manage Client Information:** Staff maintains customer details.
- **Create & Update Event Details:** Staff handles event logistics.
- **Assign & Track Tasks (includes "Create & Update Event Details")** - Task assignment is a necessary **subprocess** of managing events.
- **Manage Vendor Relationships:** Staff coordinates vendor collaborations.
- **Approve/Reject Vendor Contracts (extends "Manage Vendor Relationships")** - This means contract approval is **conditional** and applies **only when new vendors join**.
- **Generate Reports:** The system allows staff to generate reports.
- **Financial Analysis (includes "Generate Reports")** - Every report **must include** financial data.
- **Send Automated Notifications:** Staff can send updates.
- **Approve / Reject Vendor Contracts (extends "Manage Vendor Relationships")** - This means **contract approval is an optional action** based on specific vendor needs.

4.2 Class Diagram – (Sailess Raj A/L Rajendran)

Figure 3 Class Diagram of Eventure

This Class Diagram of the Eventure Event Management System proposes a recognized description of the logic's objects, their assigns, behaviours, and the relationships among them. It indicates how several objects of the structure cooperate with each other, maintaining a well-structured and manageable architecture.

There are three main user roles in the diagram which is Customer, Vendor, and Staff, all getting general behaviour and properties from the User class like login and registration. Each role has its own set of responsibilities. Clients browse services, book events, and make the payments, while Vendors will manage service quotations, accept/reject event requests, and feedback. Staff will perform admin tasks like creating events, managing vendors, and financial analysis.

The Event class is the principal item inside the system, and it store up data like event name, date, and location. The consumers deal with events in terms of a booking, whereas the Vendors offer services for booked events. The Payment class deals with financial transactions after reservation to make sure that payments are cleared before the reservation is made. The system

also has a Notification class that will notify the users of knowing updates like booking confirmations and payment status. The Report class also helps the staff members in initiating event perceptions and financial reports, developing system transparency. By defining, the class diagram puts a solid organization for Eventure system realization. This strategic approach ensures modularity, scalability, and maintainability, with easier extension of functionality as the system continues to evolve.

4.3 State Diagram – (Anusha)

Figure 4 State Diagram of Eventure

The State Machine Diagram illustrates the different states an event booking goes through within the Eventure system, emphasizing how the system reacts to user inputs and events. It maps out the complete lifecycle of a booking, starting from the user selecting the event type, venue, date, and time. The system then checks availability and if the chosen slot is unavailable, the user is prompted to select another date. If the slot is available, the user proceeds to enter the number of guests, event details, and personal information. Once all details are provided, the system reserves the venue and generates an invoice. At this stage, the booking state changes to Confirm Booking, where the user completes the payment.

The state diagram clearly illustrates two outcomes: if payment is successful, the state transitions to Invoice Sent, confirming the booking, and concluding the process. Conversely, if payment is incomplete or fails, the state moves to Booking Cancelled, ending the process. By showing each state and the conditions that trigger state transitions, the diagram effectively outlines the system's behaviour in response to different scenarios, such as payment failures, date unavailability, or successful bookings. This approach ensures a structured workflow, improves error handling, and enhances system reliability.

4.4 Activity Diagram – (Hemanth)

Figure 5 Activity Diagram of Eventure

The Activity Diagram provides a detailed overview of the step-by-step workflow for the event booking process, focusing on the sequence of actions taken by both the user and the system. It starts with the user selecting the event type, venue, date, and time. The system then checks availability and if unavailable, the user is prompted to select a different date. If available, the process continues with the user entering the number of guests, event details, and personal information. Once all necessary details are entered, the system reserves the venue and generates an invoice.

The user then reviews the invoice and confirms the booking before proceeding to payment. The diagram highlights the two possible payment outcomes: if the payment is successful, the invoice is sent, and the booking is confirmed, concluding the activity flow. However, if payment is incomplete or fails, the booking is cancelled, ending the process. This activity diagram clearly shows the flow of control between each step, including decision points where the process branches based on availability checks and payment status. By mapping out user actions and system responses, the diagram ensures a logical and efficient workflow, reducing errors and improving the overall user experience.

4.5 Sequence Diagram (Darmik Ishwar)

Figure 6 Sequence Diagram of Eventure

The sequence diagram illustrates the interaction between the user, the Eventure system, and the payment gateway during the event booking process in a structured, step-by-step manner. The process begins when the user selects the event type, prompting the system to display available event options. The user then chooses the event date, number of attendees, and time, after which the system confirms the selection. Next, the user fills in customer details, and the system verifies the information before proceeding. Once all details are confirmed, the user initiates the event booking, prompting the system to generate an invoice and request payment through the payment gateway. The payment gateway then waits for the deposit payment within a three-day period. During this time, the system notifies the user of the pending payment status. If the user successfully completes the payment, the payment gateway confirms the transaction, and the

system updates the booking status, sends the final invoice, and completes the booking process. However, if the payment is not completed within the given time, the system cancels the booking, and the process terminates. The diagram follows a horizontal format, making it easier to visualize the sequential flow of interactions between the entities. By representing system operations, conditional actions, and dependencies in this structured manner, the sequence diagram provides a clear understanding of how the Eventure system processes event bookings, payments, and cancellations efficiently.

5.0 Implementation and Deployment

5.1 Construction Tools

Visual Studio Code

Visual Studio Code (VS Code) is a perfect development tool for the Eventure project, offering a versatile and effective environment ideal for creating web and mobile applications. As Eventure needs a system to automate event reservations, client management, and vendor coordination, VS Code's capability to support various programming languages like JavaScript, Python, and PHP enables the development team to smoothly create both frontend and backend elements. This adaptability guarantees that elements such as client portals, vendor management, and financial tracking can be created and incorporated seamlessly.

A significant benefit of utilizing VS Code for Eventure is its integrated debugging tools, which assist developers in swiftly spotting and resolving issues. This enhances code quality and accelerates the development process, guaranteeing that functional prototypes are produced quickly which is a vital element for Eventure's expanding business requirements. Moreover, the integration of VS Code with Git enables the team to effectively handle version control, monitor alterations, and work together on features in real-time, which is crucial for integrating user feedback from Samantha and her team.

Additionally, VS Code's vast collection of extensions boosts productivity by providing auto-completion, syntax highlighting, and framework integrations like React for the client portal or Django for backend administration. Its adaptable interface and integrated terminal capabilities further enhance the workflow, enabling developers to run commands directly in the IDE. In general, the speed, adaptability, and robust capabilities of Visual Studio Code position it as a perfect tool for building Eventure's automated event management system, aiding the company in scaling its operations effectively.

MySQL

MySQL is a powerful relational database management system (RDBMS) that plays a crucial role in the development of the Eventure Event Management System. As the system needs to store and manage structured data efficiently, MySQL provides a robust solution for handling client information, event details, vendor contracts, and financial transactions. It ensures data integrity through ACID compliance, allowing secure and accurate transaction processing, which is essential for managing event bookings and payments.

One of the key advantages of MySQL is its ability to handle large datasets while maintaining high performance through optimized indexing and query caching. This ensures that event planners, vendors, and clients can access and retrieve data quickly, even as the business scales. Additionally, MySQL offers automated backup options and transaction rollback features, preventing data loss and ensuring smooth recovery in case of errors.

MySQL also supports multi-user access, allowing multiple stakeholders, including event planners and vendors, to interact with the system simultaneously without compromising performance. Its seamless integration with backend technologies such as Node.js, Django, and Spring Boot makes it an ideal choice for managing real-time data through RESTful APIs. Furthermore, MySQL is well-suited for financial management within the system, as it securely stores invoices, tracks payments, and maintains financial records with consistency and accuracy.

By leveraging MySQL, the Eventure system will benefit from a reliable, scalable, and secure database solution that ensures efficient data management. Its ability to support structured queries, maintain security through role-based access control, and provide seamless integration with web applications makes it a fundamental tool in streamlining event planning and management operations.

Stripe and PayPal

Stripe and PayPal are two reliable payment gateways that offer extensive support for online transactions. Stripe is widely used for its flexibility, allowing businesses to accept multiple payment methods, including credit and debit cards, digital wallets like Google Pay and Apple Pay, and even direct bank transfers. It provides advanced fraud detection mechanisms, encrypting financial data to ensure secure transactions. Additionally, Stripe automates invoicing, allowing clients to receive detailed billing statements and track payments efficiently. PayPal, on the other hand, is a globally recognized payment solution that enables users to make payments using their PayPal balance, linked bank accounts, or credit cards without needing to enter financial details for every transaction. It supports international payments, making it an excellent choice for expanding Eventure's reach to global clients. Furthermore, PayPal offers buyer and seller protection policies, reducing risks associated with fraudulent transactions. Both payment gateways integrate seamlessly with web and mobile applications, providing a smooth checkout experience while ensuring compliance with financial regulations and security standards. By incorporating Stripe and PayPal into the Eventure system, clients will have multiple payment options, fostering trust and convenience while streamlining financial management for event planners and vendors.

5.2 Proof of Concept

A proof of concept was created to demonstrate the user interface and flow of the Eventure system. This prototype includes key modules such as the Client Portal, Admin Dashboard, and Vendor Management. The Client Portal allows users to view services, check availability, and make bookings, enhancing user experience and engagement. The Admin Dashboard centralizes event management, financial tracking, and user communications, ensuring efficient operational oversight. By visualizing the system's design and functionality, this proof of concept validates the feasibility of the proposed solution, ensuring alignment with Eventure's business requirements.

The image shows a web page for Eventure. On the left, there is a vertical banner with a photograph of an event space featuring white drapes, chandeliers, and floral decorations. The banner contains the Eventure logo at the top, the text "Welcome back!" in a large serif font, the text "Already have an account?" in a smaller serif font, and a "Sign In" button. On the right, the main content area has a dark blue background. It features the heading "Sign Up to Eventure" in a large white serif font. Below this, there are three white input fields labeled "YOUR NAME:", "EMAIL:", and "PASSWORD:". At the bottom of this section is a "Sign Up" button.

Eventure is the result of Samantha's vision and the hard work of a passionate team dedicated to creating memorable experiences. Behind every successful event, there's a group of people striving to connect clients with the best vendors and solutions tailored to their needs.

From intimate weddings to large corporate gatherings, Samantha and her team have built Eventure into a trusted name for seamless event planning. Their combined expertise and commitment to excellence have helped countless clients bring their ideas to life, turning every event into a remarkable success

MISSION

To be the leading platform for seamless event planning, empowering clients to create unforgettable experiences with ease and excellence

To connect clients with trusted vendors, providing tailored solutions that bring their event visions to life while upholding the highest standards of quality and service

Savory Affair

A catering service that brings bold flavors and artistic presentation to your table

Fusion Feast

Combining diverse cuisines to deliver a memorable dining experience for all types of events

Christian

Heavenly Bites Catering

Delighting guests with comfort food classics and innovative menu options

Epic Eats

Crafting unique dishes with fresh, high-quality ingredients for any celebration

Savor Elegance

Focused on creating refined and elegant menus that leave a lasting impression

Punjabi

Tasteful Affairs

Known for personalized menus that reflect your style and event theme

The Culinary Table

Providing gourmet catering with a focus on sustainability and local ingredients

Divine Dishes Catering

Specializing in hearty meals and decadent desserts that please every palate

View Recorded Information					
Num.	Client Details	Venue Information	Date & Time	Guest Count	Event Agenda
1	Adem's Wedding	Puchong Hall	15/03/2025	500 pax	Speaker: Aaron
2	Hemanth's 21 st Birthday	Subang Recreational Hall	25/03/2025	100 pax	Speaker: Anusha
3	Abu's Gender Reveal	Sunway Hall	29/03/2025	50 pax	Speaker: Ali
4	Anusha's 21 st Birthday	Puchong Hall	14/04/2025	200 pax	Speakers: Hemanth & Sailesh

Figure 38: Recorded Information of Events

The screenshot displays a web page titled "Event Status Page". At the top, there is a dark blue navigation bar with links for "HOME", "ABOUT US", "SERVICES", and "CONTACT US", along with a user profile icon. The main content area features a large, bold title "Event Status Page" centered over a background image of a wedding reception. Below the title is a table with four columns: "Num.", "Event", "Date & Time", and "Status". The table contains four rows of event data. The background image shows a long, elegantly decorated wedding reception hall with white tablecloths, gold centerpieces, and a checkered floor.

Num.	Event	Date & Time	Status
1	Adam's Wedding	15/03/2025 @ 2.30p.m.	Booked
2	Hemanth's 21 st Birthday	25/03/2025 @ 7:00p.m.	Pending
3	Abu's Gender Reveal	29/03/2025 @ 5:00p.m.	Pending
4	Anusha's 21 st Birthday	14/04/2025 @ 7:30p.m.	Booked

5.3 Testing

User Acceptance Testing (UAT)

User Acceptance Testing (UAT) is performed to confirm that the Eventure system satisfies business needs and user expectations. It emphasizes guaranteeing the system's usability, functionality, and workflow precision from the viewpoint of the end-user. UAT is vital since Samantha and her team are the main users, and the system needs to meet their operational requirements such as event bookings, vendor oversight, and financial monitoring. Through the simulation of real-life situations, UAT verifies that the system is user-friendly, effective, and prepared for launch.

For UAT, important users like Samantha, event organizers, and administrative personnel will be involved to offer thorough feedback. Test scenarios will be created to encompass all system features, such as viewing event services, verifying availability, making reservations, handling event details, coordinating with vendors, and monitoring payments. Every scenario will feature clearly outlined acceptance criteria, including successful booking confirmations, real-time updates, and smooth payment processing. Input will be gathered regarding usability, functionality, and general experience. In response to this feedback, essential modifications will be implemented to optimize navigation, strengthen data validation, and clarify notification processes. This repetitive feedback cycle guarantees ongoing enhancement and conformity with user needs. UAT is crucial for obtaining stakeholder consent, reducing post-launch complications, and guaranteeing that the system delivers a favourable user experience.

Integration Testing

Integration Testing is conducted to verify that different modules within the Eventure system work together seamlessly. It ensures consistent data flow, accurate communication, and smooth functionality across interconnected components, including the client portal, event management, vendor coordination, and financial tracking. This method is essential for Eventure because the system relies on multiple modules working in harmony, and integration failures could lead to booking conflicts, payment discrepancies, or communication breakdowns. Additionally,

Integration Testing verifies third-party integrations, such as payment gateways (Stripe, PayPal) and email notifications, ensuring secure transactions and accurate notifications.

Integration Testing will be performed by identifying critical integration points, such as booking and availability modules, payment gateways, vendor management, and notification systems. Test scenarios will verify real-time availability checks, accurate vendor assignments, secure payment processing, and consistent communication flow. For example, booking an event will be tested to ensure it accurately updates the calendar, triggers vendor notifications, and generates the correct invoice. The testing process will focus on identifying data inconsistencies, communication failures, and workflow disruptions between modules. Any issues detected will be documented, prioritized, and resolved promptly, followed by regression testing to confirm that fixes do not introduce contemporary issues. By ensuring accurate interactions between modules and verifying data integrity, Integration Testing enhances system reliability and operational efficiency.

5.4 System Deployment

System deployment is a critical phase in software development, where a newly developed system is introduced to replace an existing one. The choice of the system change-over method significantly impacts the transition's success, as it determines the risk level, cost, and overall efficiency of the deployment. Two common system change-over methods that can be considered for the Eventure Event Management System are Direct Cutover and Parallel Operation. These methods have distinct advantages and disadvantages, which must be analysed before selecting the most suitable approach for the project.

Direct Cutover Method

The Direct Cutover approach involves an immediate switch from the old system to the new system, meaning that the old system is completely decommissioned once the new system becomes operational. One of the primary advantages of this method is its simplicity since only one system is in use at a time, there are fewer logistical concerns, and the transition is faster. Additionally, cost savings are significant because the organization does not need to maintain and operate both systems simultaneously. However, the biggest disadvantage of this approach is its high risk. If the new system encounters unexpected failures or bugs, there is no backup available, which could lead to major disruptions in business operations. Without a functioning fallback option, users and clients might experience delays or loss of critical data, causing dissatisfaction and reputational damage.

Parallel Operation Method

In contrast, the Parallel Operation method allows both the old and new systems to run simultaneously for a specified period. This method is safer because the old system remains functional while users gradually transition to the new system. One of its major advantages is that it reduces risk if any critical issues arise in the new system, operations can still continue using the old system without major disruptions. Additionally, this method allows users to compare outputs from both systems, ensuring that the new system produces accurate and reliable results before fully committing to its implementation. However, Parallel Operation also has significant disadvantages, primarily in terms of cost and workload. Running both systems simultaneously requires double the resources, as data must be entered into both systems,

increasing administrative efforts. Additionally, users must divide their attention between both systems, which could lead to confusion and inefficiencies. This method may also place extra strain on system infrastructure, potentially leading to performance bottlenecks.

Best Change-over Method for the Eventure Project

For the Eventure Event Management System, the Parallel Operation method is the most suitable choice. Since Eventure is transitioning from a manual business process to a fully digitalized system, the risks associated with an immediate Direct Cutover approach are too high. Running both systems in parallel ensures that event planners, vendors, and clients can gradually adapt to the new system without disrupting ongoing event planning operations. This approach allows for thorough validation of the new system's functionalities, ensuring that event bookings, vendor management, financial transactions, and client communications operate correctly. Additionally, since the system is handling sensitive financial transactions, it is essential to ensure that all invoicing and payment processing functions work without errors before fully committing to the new platform.

To implement the Parallel Operation method, the transition will be carried out in three key stages. First, data migration and integration testing will take place, ensuring that all existing client, event, and vendor data is accurately transferred from manual records to the new system. Second, a trial phase will begin, where employees will use both systems simultaneously while comparing results. Feedback will be collected to identify any discrepancies or usability challenges. Finally, once confidence in the new system's stability is established, the old manual processes will be phased out, and full transition to the Eventure system will be completed.

By using the Parallel Operation method, Eventure can ensure a smooth and controlled transition, minimizing operational risks while allowing for gradual adaptation to the new system. This method provides the necessary safety net to address any potential issues before fully retiring the manual system, ensuring business continuity, user confidence, and a seamless event management experience.
